Parents reject HPV vaccine as studies reveal autoimmunity, deaths and regulatory fraud

- A mother’s investigation into her daughter’s death after Gardasil revealed Merck’s false VAERS report and CDC inaction.
- Independent researchers found HPV DNA fragments in vaccine vials, linking Gardasil to fatal reactions, yet faced censorship.
- Cervical cancer rates were already declining before Gardasil’s approval, with no proof the vaccine prevents cancer.
- Gardasil’s risks include autoimmunity, neurological damage, and death, with VAERS reports vastly underestimating true injury numbers.
- Parents increasingly reject Gardasil due to lawsuits, conflicts of interest, and evidence that Pap smears are safer and more effective.

When Emily Tarsell lost her 21-year-old daughter, Christina, just 18 days after her third Gardasil shot, she assumed health authorities would investigate. Instead, she found a system rigged to protect Merck—one where the CDC ignored her daughter’s death, Merck filed a false VAERS report blaming a "viral infection," and regulators dismissed serious injuries as "non-serious." Her story is far from unique. Across the U.S., parents are increasingly refusing the HPV vaccine, not out of ignorance, but because they’ve seen the evidence: Gardasil is linked

to autoimmunity, neurological damage, and even death, while its cancer-prevention claims are wildly exaggerated.

A new *JAMA Pediatrics* study reveals significant disparities in HPV vaccination rates, with Southern states like Mississippi, Georgia, and Oklahoma lagging far behind Northeast states. But the real question isn't why some states resist; it's how this vaccine was ever approved in the first place. The answer lies in a decades-long pattern of regulatory capture, data manipulation, and corporate greed that has left thousands of young lives shattered.

The vaccine that wasn't needed

Children's Health Defense has long been documenting the vaccine's troubling track record. They pointed out that Dr. Sin Hang Lee, a pathologist who tested Gardasil vials from multiple countries, found HPV DNA fragments in every sample, despite the FDA's claims that the vaccine contained no genetic material. His postmortem analysis of a New Zealand girl who died after vaccination confirmed the presence of HPV-16 DNA, suggesting the vaccine may have triggered her fatal reaction. Yet when he tried to publish his findings, he faced "global editorial censorship." Journals refused to print his work, not because it was flawed, but because it threatened Merck's narrative.

The truth is that cervical cancer was already in decline before Gardasil's 2006 approval, thanks to Pap smears. As biochemist Dr. Lucija Tomljenovi? explains, "The rate of cervical cancers in the U.K. have been rapidly declining and they have reached their lowest point long before HPV vaccines were introduced." Clinical trials never even tested whether Gardasil prevents cancer; they measured precancerous lesions (CIN2), which often resolve on their own. Yet regulators allowed Merck to market the shot as a near-miracle cure, claiming it could reduce cervical cancer by 80%—a figure pulled from flawed Cochrane reviews that relied on studies riddled with "serious or critical risk of bias," according to Tomljenovi?.

A vaccine more dangerous than the disease

If Gardasil's benefits are dubious, its risks are undeniable. The Vaccine Adverse Event Reporting System (VAERS) has logged 43,330 injuries in those under 30, including dozens of deaths (with researchers estimating that fewer than 1–6% of adverse events are ever reported, the true number of injuries could be many times higher still.) A Danish study published in the *Journal of Autoimmunity* found that 92% of symptomatic Gardasil recipients had autoantibodies attacking their nervous systems, compared to just 19% of healthy controls. In the Danish study, 83% of girls who sought care for post-vaccination symptoms reported moderate or severe fatigue, compared to none of the healthy vaccinated controls.

Yet when European regulators investigated Gardasil's link to POTS (postural orthostatic tachycardia syndrome), they didn't conduct independent research. They let Merck analyze its

own data. The company overestimated background POTS rates while underreporting vaccine injuries, ensuring the numbers would show no link. The European Medicines Agency (EMA) rubber-stamped Merck's conclusions even though leaked documents revealed experts had serious doubts. Two years later, the CDC replicated Merck's flawed methods in a VAERS analysis, concluding there was "no safety signal." The lead researcher? Dr. Jorge Arana, who left the CDC for Merck months after publishing the study.

Why parents are saying no

Given this history of deception, cover-ups, and real harm, it's no surprise that HPV vaccine refusal rates surged 80% between 2015 and 2018. Parents aren't falling for the marketing anymore. They've seen the lawsuits—over 200 pending cases alleging Merck hid Gardasil's dangers. They've read the autopsy reports, like that of 14-year-old Joel Gomez, a healthy football player who died of a "myocardial infarction", which is something his pathologist called "unheard of" in a boy his age.

And they've learned the financial motives behind the push. Merck lobbied aggressively to mandate Gardasil, even drafting legislation itself. The company replaced lost Vioxx profits (after the drug was pulled for killing tens of thousands) with Gardasil revenue. Meanwhile, former CDC director Julie Gerberding left the agency to become president of Merck's vaccine division, where she made over $100 million.

The real solution: Pap smears, not pharmaceutical profits

The irony? No one needs to die from cervical cancer because Pap smears are already a valuable prevention tool. As Dr. Tomljenovi? states, "Exposing healthy children to long-term, unpredictable and incompletely understood vaccine risks for no proven substantial benefits is utterly unscientific, unreasonable, immoral, and plain reckless." Yet the CDC still recommends Gardasil for all adolescents, while censoring dissent and ignoring injured families.

The HPV vaccine isn't about health. It's about profit, control, and a broken regulatory system that lets corporations police themselves. Until that changes, parents will keep saying no... not out of fear, but because they've done their homework. And in a system this corrupt, that's the only safe choice.
